

# Identify Hidden Gluten Exposure in Symptomatic Patients

***The Fecal Gluten Peptide test provides a direct measure of gluten exposure.***

Do you have patients with celiac disease or non-celiac gluten sensitivity who are adhering to a gluten-free diet yet continue to experience symptoms?

**Fecal Gluten Peptide** testing offers a direct way to confirm recent gluten ingestion — *helping determine whether ongoing exposure is contributing.*

This test quantitatively evaluates gluten immunogenic peptides in stool, reflecting ingestion within approximately 2–4 days. By detecting recent exposure, it helps uncover hidden sources of gluten and provides objective data to support clinical decision-making.

**Identify sources of inadvertent gluten ingestion and refine protocols with greater precision.**

## Identify, Monitor, and Manage Gluten Exposure with Greater Precision

- Quantitatively evaluate gluten peptides in stool to assess recent exposure
- Monitor adherence to a gluten-free diet
- Detect unintentional gluten ingestion, even in the absence of symptoms
- Support assessment of refractory celiac disease

### Designed to Work with GI-MAP®

While GI-MAP provides a comprehensive overview of gut microbiome composition, pathogens, and intestinal health markers, the addition of **Fecal Gluten Peptide** testing offers targeted insight into recent gluten ingestion.

Together, they provide a more complete clinical picture—supporting clearer interpretation of symptoms and more precise patient management.

### Identify sources of inadvertent gluten ingestion and refine protocols with greater precision.

#### TEST ORDERING & SPECIMEN REQUIREMENTS

- GI-MAP® - GI Microbial Assay Plus | Single Stool Collection
- Fecal Gluten Peptide | Single Stool Collection

*The Fecal Gluten Peptide test is available as an add-on to GI-MAP or as a stand-alone test.*
